

Material Master UI – Functional & Technical Documentation

1. Introduction

The new Material Master UI is designed to simplify the process of material creation and maintenance by organizing the data into **logical sections (UI Assignment Blocks)**.

Instead of showing all **1100 fields**, the system groups them into **48 UI Assignment Blocks**, allowing users to fill information section-by-section.

The UI provides:

- Guided material creation
 - Section-wise validation
 - Visual status indicators
 - Flexible data entry and editing
-

2. Initial Material Creation Flow

When a user starts creating a new material, the following fields appear:

- **Industry Sector**
- **Material Type**

After selecting these fields, the user clicks **Select Views** to proceed.

Some views require **Plant information**.

If the **Plant is mandatory**, the user cannot proceed without entering it.

This validation must be handled before opening the next stage.

3. View Selection Process

After entering the required details, the system provides two possible approaches.

Option 1 – Guided Question Flow

The system asks the user a few questions to determine which views to load.

Example questions:

1. Do you want to proceed with a **Full Product Creation**?
2. Do you want to create **Template Product Only**?
3. Do you want to maintain **Sales Data / Financial Data**?

Based on the answers, the system determines which UI sections should be enabled.

Example

If the user selects:

- Full Product
- Sales Data

Then the system will load:

- Basic Data
- Plant Data
- Sales Data
- Accounting

Option 2 – Direct Section Selection (Recommended)

Instead of questions, the UI displays **buttons representing each section**.

Example Sections:

- Basic Data
- Additional Data
- Plant Data
- Sales Data
- Warehouse Data
- Accounting

Users can click any section to maintain the data.

This approach gives **more control and faster navigation**.

4. Section Navigation

Each section represents a **UI Assignment Block**.

When a user clicks a section button:

A new screen opens with:

- Fields belonging to that section
- **Back button**

- **Done button**

Example:

Basic Data Section

Fields:

- Material Number
- Material Type
- Industry Sector
- Base Unit of Measure

5. Section Completion Process

When the user clicks **Done**:

The system performs **validation checks**.

Validation Rules

- Mandatory fields must be filled
- Correct format validation
- Business rule validation

If validation passes:

The section is marked **Completed**

6. Section Status Color Indicators

Each section button shows a **status color**.

Color	Meaning
Green	Mandatory fields completed
Yellow	Some mandatory fields missing
Red	Validation errors
Orange	Data modified during update

Example:

Basic Data → Green
Plant Data → Yellow
Sales Data → Red

7. Display Modes

The UI behaves differently depending on the operation.

7.1 Creation Mode

While creating a material:

Sections show **validation colors**.

User can navigate and complete sections.

7.2 Update Mode

While updating an existing material:

Changed fields must be highlighted in **Orange**.

Example:

Old Value → KG

New Value → LB

The system highlights the field.

7.3 Display Mode (Read Only)

When displaying material data:

- All sections appear without colors.
- Only show validation colors when errors exist.

This keeps the display UI clean.

8. Dropdown Navigation (UI Assignment Block Selector)

A dropdown list allows the user to jump directly to a section.

Example dropdown:

Basic Data

Plant Data

Sales Data

Warehouse Data

Accounting

Selecting an item navigates to the respective UI section.

9. Buttons

At the bottom of the UI:

Buttons available:

- **Submit**
- **Save**
- **Save as Draft**

Submit

Validates all sections and saves the material.

Save

Saves the current data.

Draft

Allows incomplete data to be saved.

10. Additional Data Structure

Some sections contain **multiple tabs**.

Example:

Additional Data includes **7 tabs**.

Example structure:

Additional Data

- Tab 1
- Tab 2

- Tab 3
- Tab 4
- Tab 5
- Tab 6
- Tab 7

Each tab contains related fields.

11. Scale Consideration

System Size:

- **48 UI Assignment Blocks**
- **1100 fields**

Therefore the system must be **dynamic and configurable**.

Hardcoding UI fields is **not recommended**.
